MANAGED CODE
SERVICES

Looking for a safe home for your organisation's technical intellectual property? Managed Code Services help control the risks associated with source code no longer under active development by checking it in to a Trustmarque repository attached to common maintenance services.

Whether you have an in-house app with no support, you've acquired source code from a supplier, or your internal development team have moved on to bigger and better things, knowing that you have a responsive partner with ready access to your source code helps you and your team concentrate on the future rather than the past.

Following an initial onboarding activity we will provision a repository for your source code to help you get it checked in. We will perform an annual health check and supply a report detailing potential risk and remediation, alongside a menu of on-demand maintenance services.

When you're ready to invoke a maintenance service our existing knowledge of your code and access to repositories enables us to quickly and accurately quote for work.

Why connect to Managed Code Services?

Code assets carry an invisible growing risk of technical debt, a problem exacerbated when the delivery teams managing them are focussed elsewhere. Managed Code Services helps you to mitigate that risk.

EXPERTISE

- Dedicated technology expertise embedded within your organisation
- Proven expertise of technology delivery and asset management across a range of public and private sector organisations

FAST RESPONSE TIMES

- Fast and accurate response times

Solution Overview:
Managed Code Services

Managed Code Services are provided annually, and include:

1
Code respository to store your application code.

2
An annual health check and report tracking risk factors.

3
A menu of maintenance services ready to be deployed on-demand.

These maintenance services cover common scenarios encountered with legacy code management, though not all are applicable to every type of legacy code:

- **Reverse Engineering** – where you own the IP and have deployment assets, but no longer have code available.
- **Standards Rollout** – establish, enforce, and roll out conventions to make code more manageable.
- **Documentation** – add code comments describing the role and purpose of code elements.
- **Compliance** – agree compliance and pattern rules, and schedule periodic audits.
- **Test coverage** – develop unit tests to establish a behaviour baseline for managing future change.
- **Packaging** – application packaging to support automated deployments.
- **Performance test** – identify code bottlenecks with a repeatable performance test suite.
- **Monitoring** – increase the level of logging across your application to help debug live issues.
- **WCAG** – provide an accessibility report for a web application.
- **Environment management** – automatically create application environments as part of deployment.

Why Trustmarque?

Trustmarque has a breadth and depth of experience with public and private sector clients in successfully delivering and maintaining bespoke applications and platform customisations.

Working with Microsoft for 30 years across a wide range of products and services has helped us to build an experienced and knowledgeable team, with a unique blend of capabilities across all aspects of applications, business insights, and systems management.

We simplify IT, enabling our customers to accelerate their organisational objectives with an expert technology partner.

Next steps

Managed Code Services are safe home for inactive (or intermittently active) development projects. Should your organisation wish to invest in extending your IP it can be transferred to our Innovation Labs.

Innovation Labs provide a reliable innovation delivery model with predictable costs. This service supports your cloud journey by optimising and extending your application portfolio with cloud-native technologies.
